## Types and $\lambda$ -calculus

## Problem Sheet 1

- \* 1. Which of the following are terms? For those that are terms, write out a proof tree justification.
  - (a)  $(\lambda x.((xx)x))$
  - (b)  $(\lambda(\lambda x.x))$
  - (c) ((xy)z)
- \* 2. Write these terms using the minimum number of parentheses and  $\lambda$ , according to our conventions.
  - (a)  $(\lambda y.((yy)(zz)))$
  - (b)  $(\lambda y.(((yy)y)y))$
  - (c)  $((xy)(\lambda y.(\lambda z.(z(xy)))))$
- \* 3. Write the term  $(\lambda xyz.xy(xz))(\lambda xy.x)$  with all the parentheses and  $\lambda$  that we will usually omit tediously put back in.
- \*\* 4. Note that, by the conventions of logic,  $A \Rightarrow B \Rightarrow C$  is a shorthand for  $A \Rightarrow (B \Rightarrow C)$  and conjunction binds tighter than implication, so  $A \land B \Rightarrow C$  means  $(A \land B) \Rightarrow C$ .

Give proofs of the following.

- (a)  $\neg A \Rightarrow A \Rightarrow B$
- (b)  $(A \land B \Rightarrow C) \Rightarrow A \Rightarrow B \Rightarrow C$
- (c)  $\neg (A \land \neg A)$
- (d)  $(A \Rightarrow B) \Rightarrow (B \Rightarrow C) \Rightarrow A \Rightarrow C$
- (e)  $\neg A \land \neg B \Rightarrow \neg (A \lor B)$
